

SACHIN KUMAR M

Product Designer · Design Systems · Enterprise UX

Chennai, India · Open to Relocate | er_sachinkumarm@outlook.com | +91 9566747221 | [linkedin.com/in/sachin1720](https://www.linkedin.com/in/sachin1720) | sachinuxportfolio.vercel.app

PROFESSIONAL SUMMARY

Product Designer with 2.8 years of experience owning enterprise healthcare and insurance workflows at Tata Consultancy Services, where my design decisions reach a platform used by 100K+ people. I focus on design systems — building the components, tokens, and documentation that let design and engineering move faster without losing consistency — and I led the design side of a legacy-to-cloud platform migration end to end. I work directly with Business Analysts, Architects, and Developers to turn ambiguous requirements into shipped, accessible product experiences. Looking for a Product Designer role at a product-led company in fintech, SaaS, or healthtech.

EXPERIENCE

UX Designer · Tata Consultancy Services

Sep 2023 – Present

Client: Cigna Healthcare — Enterprise Healthcare Platform · Chennai, India

- Own end-to-end UX for enterprise healthcare and insurance workflows serving 100K+ users — from discovery and requirement mapping through high-fidelity design, prototyping, and developer handoff.
- Lead the design side of migrating core healthcare workflows from a legacy Pega system to AWS, redesigning screens and flows for the new platform while keeping day-to-day operations uninterrupted for existing users.
- Build and govern an enterprise design system with 150+ reusable components and 1,000+ variants across 12 product modules, enabling consistent experiences and improving collaboration between design and engineering.
- Established reusable UX patterns that reduced duplicate design effort across multiple product teams and accelerated design consistency during feature development.
- Embed WCAG 2.1 AA accessibility standards into the design process — keyboard navigation, screen reader support, color contrast — ensuring accessibility is addressed throughout design rather than during final QA.
- Conduct usability testing, heuristic evaluations, and stakeholder workshops with Business Analysts, Developers, and Architects to turn ambiguous requirements into workable flows.
- Partner with Product Managers to scope MVPs and prioritize features against real operational constraints, not just stakeholder preference.
- Integrated AI-assisted workflows using ChatGPT and Claude to accelerate research synthesis, UX documentation, and content generation while maintaining design quality.

Tools: Figma · FigJam · Jira · Confluence · Pega · AWS

SELECTED ACHIEVEMENTS

- Led UX modernization of enterprise healthcare workflows during a legacy-to-cloud migration.
- Built and governed a scalable design system supporting 12+ product modules.
- Improved design-to-engineering collaboration through reusable components, design tokens, and documentation.
- Delivered accessible enterprise experiences aligned with WCAG 2.1 AA.

PORTFOLIO PROJECTS

Healthcare Design System | Enterprise Design System

- Designed and scaled a design system supporting healthcare applications across 12 product modules — 150+ components, 1,000+ variants, and a token architecture built for reuse.
- Documented component states, usage guidelines, and accessibility notes so the system could be adopted by other designers without direct supervision.

Pharmacy Management System — Healthcare Product Design Case Study

- Designed three end-to-end feature flows for an enterprise pharmacy platform — a safety-critical POS block for expired-medicine sales, a prioritized inventory alert dashboard, and a supplier balance/statement module — each built around a distinct risk and usage pattern rather than a single interface pattern.
- Built a shared design system (colors, components, status patterns) across all three flows to demonstrate consistency and reuse at a product level, not just screen-by-screen design.
- Extended the core flows into three additional design challenges — adapting for first-time users, scaling across POS/desktop/mobile contexts, and calibrating friction for an irreversible inventory action — to show range beyond the base assignment.
- Documented assumptions, edge cases (empty/error/loading/success states), and design rationale for every flow, mirroring real handoff documentation rather than polished screens alone.

Legacy Platform Modernization (Pega → AWS)

- Redesigned core healthcare workflows during a legacy-to-cloud migration, simplifying screens without disrupting active users.
- Worked directly with Business Analysts and Architects to translate legacy business logic into new, usable flows.
- Supported engineering through implementation and design QA to keep the shipped product aligned with the intended UX.

Frictionless Payment Checkout — Fintech Case Study

- Studied a multi-step payment flow to find where users dropped off, using usability testing to isolate confusing moments in confirmation and error states.
- Redesigned the flow with clearer state feedback and fewer steps; usability testing showed a meaningful drop in task completion time.
- Delivered a developer-ready prototype with token-based specs for web and mobile.

SKILLS

Product Design: Product thinking, UX strategy, information architecture, interaction design, wireframing, prototyping, design QA

Design Systems: Design tokens, Figma variables, component architecture, design governance

UX Research: User interviews, usability testing, journey mapping, heuristic evaluation

Accessibility: WCAG 2.1 AA, screen reader testing, keyboard navigation

Collaboration: Product Managers, Business Analysts, Developers, Architects, Agile

AI Tools: ChatGPT, Claude — research synthesis, documentation

Design Tools: Figma, FigJam, Adobe XD, Miro, Jira, Confluence

EDUCATION

B.E. Mechatronics Engineering

K.S. Rangasamy College of Technology, Thiruchengode · 2018 – 2022
